

WHAT IS CLAIMED IS:

Sub
A4
5 1. An image display apparatus comprising:
a light source for supplying illumination light;
a reflection type display device which reflects
the illumination light and modulates the illumination
light into image light;

an illumination optical system for guiding the
illumination light to the reflection type display
device;

10 a first optical member for directing the
illumination light toward the reflection type display
device;

09842124-042601
15 a second optical member including a secondary
light source generating part generating a secondary
light source with the illumination light emitted from
said light source and a reflecting surface which guides
illumination light other than illumination light
directly incident on the secondary light source
generating part among the illumination light emitted
20 from said light source, to the secondary light source
generating part, and from which the illumination light
from the secondary light source emerges toward the
first optical member; and

25 a projection optical system for guiding the image
light to an observer.

2. An image display apparatus according to claim

1,

wherein the first optical member comprises a first surface on which the illumination light from the secondary light source is incident, a second surface which totally reflect the light incident from the first surface, and a third surface from which the light totally reflected by the second surface emerges toward the reflection type display device; and

the image light modulated by the reflection type display device again enters into the first optical member from the third surface, and emerges toward the projection optical system from the second surface.

3. An image display apparatus according to claim 1, wherein the secondary light source generating part is a diffusing surface.

4. An image display apparatus according to claim 1, wherein the secondary light source generating part is a reflecting and diffusing surface.

5. An image display apparatus according to claim 1, wherein the secondary light source generating part is a microlens group.

25

6. An image display apparatus according to claim 1, further comprising a directional element that is

09842124-042601

arranged between the first optical member and the second optical member, and enhances directivity of illumination light that emerges from the second optical member and enters into the first optical member.

5

7. An image display apparatus according to claim 1, further comprising:

a reflective-liquid-crystal display device as the reflection type display device; and

a polarizing member which makes the illumination light be polarized light, and/or performs analysis of the image light,

wherein the polarizing member is arranged in a position where a condition, $I_1/I_0 < 0.1$ is satisfied with letting optical intensity of outdoor daylight entering from an observer side to the projection optical system on the reflective-liquid-crystal display device be I_0 and letting optical intensity on the polarizing member be I_1 .

20

8. An image display apparatus according to claim 1, further comprising:

a reflective-liquid-crystal display device as the reflection type display device;

a first polarizing member which converts illumination light emerged from the second optical member into S-polarized light to be incident on the

25

09842124-042601

July 15

first optical member; and

a second polarizing member for analyzing the image light modulated by the reflective-liquid-crystal display device into P-polarized light.

5

9. An image display apparatus according to claim 1,

wherein the projection optical system comprises an optical element having a plurality of optical surfaces;

10

and

at least one among the plurality of said optical surfaces is a reflecting surface and at least one is a rotationally asymmetrical surface.

15

10. An image display apparatus comprising:

a light source for supplying illumination light;

a reflection type display device which reflects the illumination light and modulates the illumination light into image light; and

20

an illumination optical system for guiding the illumination light to the reflection type display device; and

wherein the illumination optical system comprises:

a first optical member for directing the

25

illumination light toward the reflection type display device; and

a second optical member including a reflecting

09842124-042601

surface which deflects a principal optical path of the illumination light from the light source and emitting the illumination light, reflected by the reflecting surface, toward the first optical member;

5 a projection optical system for guiding the image light to an observer.

11. An image display apparatus according to claim 10,

10 wherein the first optical member comprises a first surface on which the illumination light is incident, a second surface which totally reflects the light incident from the first surface, and a third surface from which the light totally reflected by the second
15 surface emerges toward the reflection type display device; and

 the image light modulated by the reflection type display device again enters into the first optical member from the third surface, and emerges toward the
20 projection optical system from the second surface.

12. An image display apparatus according to claim 10,

 wherein the reflecting surface of the second
25 optical member is a secondary light source generating surface which generates a secondary light source with the illumination light emitted from said light source.

09842124.042601

13. An image display apparatus according to claim
12,

wherein the second optical member has a reflecting
surface which guides illumination light other than
5 illumination light, directly incident on the secondary
light source generating surface, to the secondary light
source generating surface among the illumination light
from said light source.

10 14. An image display apparatus according to claim
10, further comprising a directional element that is
disposed between the first optical member and the
second optical member, and enhances directivity of
illumination light emerged from the second optical
15 member and entering into the first optical member.

15. An image display apparatus according to claim
10, further comprising:

a reflective-liquid-crystal display device as the
reflection type display device; and

a polarizing member which makes the illumination
light be polarized light, and/or performs analysis of
the image light,

wherein the polarizing member is arranged in a
25 position where a condition, $I1/I0 < 0.1$ is satisfied
with letting optical intensity of outdoor daylight
entering from an observer side to the projection

0942124-042601

Sub
JP

optical system on the reflective-liquid-crystal display device be IO and letting optical intensity on the polarizing member be I1.

5 16. An image display apparatus according to claim 10, further comprising:

 a reflective-liquid-crystal display device as the reflection type display device;

10 a first polarizing member which converts the illumination light emerged from the second optical member into S-polarized light to be incident on the first optical member; and

15 a second polarizing member for analyzing the image light modulated by the reflective-liquid-crystal display device into P-polarized light.

 17. An image display apparatus according to claim 10,

20 wherein the projection optical system comprises an optical element having a plurality of optical surfaces, and

 at least one among the plurality of the optical surfaces is a reflecting surface and at least one is a rotationally asymmetrical surface.

25

 18. An image display apparatus comprising:
the image display apparatus according to any one

00842124.042601

of claims 1 and 10; and

an image information output apparatus for supplying image information to the image display apparatus.

5

19. An optical system comprising:

an illumination optical system for guiding illumination light to a reflection type display device; and

10

wherein the illumination optical system comprises:

a first optical member for directing the illumination light toward the reflection type display device;

15

a second optical member including a secondary light source generating part which generates a secondary light source with the illumination light emitted from said light source and a reflecting surface which guides illumination light, other than illumination light directly incident on the secondary light source generating part among the illumination light emitted from said light source, to the secondary light source generating part, and from which the illumination light from the secondary light source emerges forward the first optical member; and

25

a projection optical system for guiding the image light, reflected by the reflection type display device, to an observer.

009424-042601

20. An optical system comprising:
an illumination optical system for guiding
illumination light to a reflection type display device;
and

5 wherein the illumination optical system comprises:

a first optical member for directing the
illumination light toward the reflection type display
device; and

10 a second optical member that includes a
reflecting surface which deflects a principal optical
path of illumination light from the light source and
emits the illumination light, reflected by the
reflecting surface, toward the first optical member;

15 a projection optical system for guiding image
light, reflected by the reflection type display device,
to an observer.
